Office Action Summary

Application No.
09/362,058

Applicant(s)
Iwasaki

Examiner
Richard Lee

Art Unit
2613

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on Apr 22, 2003
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-7 is/are pending in the application.
- 4a) Of the above, claim(s) _____ is/are withdrawn from consideration
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-7 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claims _____ are subject to restriction and/or election requirement

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
*See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). _____
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s). _____ 6) ☐ Other:

Art Unit: 2613

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sekine et al of record (5,907,434) in view of Miyakawa et al of record (5,028,994).

Sekine et al discloses an image pickup apparatus as shown in Figures 1, 2, 8, and 15, and the substantially the same three dimensional image capturing apparatus as claimed in claims 1 and 5, comprising substantially the same solid state image sensing device (i.e., 121, 122 of Figure 8) having a plurality of image capturing regions; a plurality of optical systems (see Figure 8) for forming images of a subject in the image capturing regions, each one of the optical systems corresponding to a different one of the image capturing regions (see column 11, line 53 to column 12, line 8), the optical systems including a plurality of reflection means (801, 802 of Figure 8) for reflecting rays from the subject a number of times, and at least a lens (111, 112 of Figure 8) provided to be closer to the solid state image sensing device than the closest reflection means to the subject among the reflection means, wherein the reflection means and the lenses of the optical systems are used to form, in the corresponding image capturing regions, separate images of the subject which are captured from different viewpoints having a distance therebetween; and a signal processing means (see Figure 1) for dividing a video signal from the solid state image sensing

Art Unit: 2613

device into video signals from the image capturing device into video signals representing the images of the subject captured in the image capturing regions for capturing images of the subject from the different viewpoints.

Sekine et al does not particularly disclose, though, a single, solid state image sensing device as claimed in claims 1 and 5. However, Miyakawa et al discloses a synchronized three dimensional imaging apparatus as shown in Figure 1 and teaches the conventional use of a single solid state image sensing device (40 of Figure 1, and see column 7, lines 15-60) for providing a plurality of image capturing regions for three dimensional display (see column 5, lines 14-55). Therefore, it would have been obvious to one of ordinary skill in the art, having the Sekine et al and Miyakawa et al references in front of him/her and the general knowledge of image capturing devices for three dimensional displays, would have had no difficulty in providing the single solid state image sensing device of Miyakawa et al for the three dimensional capturing and display system as shown in Figures 1 and 8 of Sekine for the same well known three-dimensional capturing purposes as claimed.

3. Claims 3 and 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sekine et al and Miyakawa et al as applied to claims 1 and 5 in the above paragraph (2), and further in view of Ishihara of record (5,737,084).

The combination of Sekine et al and Miyakawa et al discloses substantially the same three dimensional image capturing apparatus as above, but does not particularly disclose light shielding means provided at least between the single solid state image sensing device and the reflection

Art Unit: 2613

means so as to separate the optical systems for forming images of the subject and light limiting means provided to be closer to the subject than the reflection means for the $(2n-1)$ -th reflection from the solid state image sensing device along the optical systems, wherein the light limiting means prevent incidence of flux of ambient light outer from rays forming each image of the subject as claimed in claims 3 and 4. However, Ishihara discloses a three dimension shape measuring apparatus as shown in Figure 8, and teaches the conventional light shielding and light limiting means (see 17, 19 of Figures 5 and 8, column 9, lines 5-22, column 11, lines 29-56) for preventing the incidence of flux of ambient light outer from rays forming the image of the subject. Therefore, it would have been obvious to one of ordinary skill in the art, having the Sekine et al, Miyakawa et al, and Ishihara references in front of him/her and the general knowledge of three dimensional image capturings, would have had no difficulty in providing the light shielding and light limiting features of Ishihara for the three dimensional capturing system of Sekine et al for the same well known reduction of light rays from the subject purposes as claimed.

4. Claims 6 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sekine et al and Miyakawa et al as applied to claims 1 and 5 in the above paragraph (2), and further in view of Tabata et al of record (5,737,084).

The combination of Sekine et al and Miyakawa et al discloses substantially the same three dimensional image capturing apparatus as above, further including a timing generator for driving the three dimensional image capturing apparatus so as to output the images formed in the image capturing regions in the form of a single video signal and a driver (see 1504 of Figure 15 and

Art Unit: 2613

column 9, lines 63-67 of Sekine et al); a camera signal processor for implementing camera signal processing on the single video signal (see Figure 1 of Sekine et al); and each one of the reflection means corresponding to a different one of the image capturing regions (i.e., as provided by 801, 802 of Figure 8, and see column 11, line 53 to column 12, line 8).

The combination of Sekine et al and Miyakawa et al does not particularly disclose, though, the followings:

(a) wherein parallax which is the distance between the viewpoints is one centimeter or greater as claimed in claimed 6; and

(b) a signal recorder for recording on a signal recording medium the processed video signal output from the camera signal processor; a single reproducer for reproducing the video signal recorded on the recording medium; a video separating circuit for separating the reproduced video signal from the reproducer into signals corresponding to the image capturing regions; and display apparatus for displaying the signals corresponding to the image capturing regions, which are output from the video separating circuit as claimed in claim 7.

Regarding (a) and (b), Tabata et al discloses an image display apparatus with recording and reproduction capabilities as shown in Figures 2, 13, 16, 17, 19, 21, and 22, and teaches the conventional parallax from stereoscopic imagings (see column 6, lines 25-30, column 20, lines 8-14, and Figures 13A and 13B), which obviously could be one centimeter or greater as claimed. In addition, Tabata et al teaches substantially the same recording means, reproducing means, video separating circuit, and display apparatuses (see Figures 17, 19, 21, and 22). Therefore, it would

Art Unit: 2613

have been obvious to one of ordinary skill in the art, having the Sekine et al, Miyakawa et al, and Tabata et al references in front of him/her and the general knowledge of the recording, reproducing, and display of three dimensional images, would have had no difficulty in providing the recording and reproducing of videos, video separating, and display apparatuses as taught by Tabata et al for the three dimensional imaging system of Sekine et al as well as recognizing the images of the subject of Sekine et al results in a parallax effect in view of the parallax teachings of Tabata et al for the same well known three dimensional image capturing purposes as claimed.

5. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sekine et al and Miyakawa et al as applied to claims 1 and 5 in the above paragraph (2), and further in view of Ishihara (5,737,084) and Tabata et al (6,177,952).

The combination of Sekine et al and Miyakawa et al discloses substantially the same three dimensional image capturing apparatus as above, further including a plurality of imaging side reflection means (118, 119 of Figure 8 of Sekine et al) having reflectors provided to the obliquely outward, each one of the imaging side reflection means corresponding to one of a plurality of different portions of an image capturing region of the single solid state image sensing device (i.e., as provided by Miyakawa et al); a plurality of subject side reflection means (801, 802 of Figure 8 of Sekine et al) having reflectors provided outer from the imaging side reflection means so as to be oblique with respect to a subject, each one of the subject-side reflection means corresponding to a different one of the imaging-side reflection means (see column 11, line 53 to column 12, line 8), the subject side reflection means reflecting rays from the subject to the corresponding imaging

Art Unit: 2613

side reflection means; a plurality of lenses or lens units (see 116, 117 of Figure 8) provided to be closer to the single solid state image sensing device (i.e., as provided by Miyakawa et al) than the subject side reflection means in optical paths formed from the subject to the different portions of the image capturing region so that rays from the subject to the different portions of the image capturing region are reflected by the imaging-side reflection means through the lenses or lens unit, each one of the lenses or lens units corresponding to a different one of the different portions of the image-capturing region (see Figure 8 and column 11, line 53 to column 12, line 8).

The combination of Sekine et al and Miyakawa et al does not particularly disclose, though, forming a plurality of images of the subject which have parallax and a plurality of diaphragms, each one of the diaphragms corresponding to a different one of the lenses or lens unit, in which when each optical path has a lens, the diaphragms are provided to be closer to the subject than the corresponding lens and in which when each optical path has a lens unit, the diaphragms are provided to be closer to the subject than a lens of the corresponding lens unit as claimed in claim 2. However, Ishihara teaches the conventional use of diaphragms within the optical path of an imaging sensor (see 12 of Figure 8) and Tabata et al teaches the general stereoscopic imagings involving parallax caused by the images (see column 6, lines 25-30, column 20, lines 8-14, and Figures 13A and 13B). Therefore, it would have been obvious to one of ordinary skill in the art, having the Sekine et al, Miyakawa et al, Ishihara, and Tabata et al references in front of him/her and the general knowledge of three dimensional imagings, would have had no difficulty in using the diaphragm imaging optics teachings of Ishihara to provide each one of the diaphragms to a

Art Unit: 2613

corresponding different one of the lens units within the three dimensional imaging system of Sekine et al and Miyakawa et al as well recognizing that the images of the subject of Sekine et al and Miyakawa et al results in a parallax effect in view of the parallax teachings of Tabata et al for the same well known three dimensional image capturing purposes as claimed.

6. Regarding the applicant's arguments at pages 5-6 of the amendment filed April 22, 2003 concerning in general that "Sekine et al fails to disclose a single solid state image sensing device with a plurality of image capturing regions. Instead, Sekine et al discloses two CCD devices 121, 122 each with one image capturing region ... Miyakawa discloses a single camera 40 with one image capturing region. As clearly; shown in Miyakawa Figure 1, Miyakawa merges two different optical paths at mirror 25 before they reach the camera 40 ... Unlike Applicant's claim 1, nowhere does Miyakawa disclose or suggest a plurality of image capturing regions associated with different optical paths ... As claimed in claim 1, separate images are formed in different image capturing regions. This is unlike Miyakawa, wherein separate images are received by all of Miyakawa's light receiving elements 42 ...", the Examiner respectfully disagrees. It is submitted again that since Miyakawa et al teaches optical paths 1 and 2 as shown in Figure 1 for providing right and left images (i.e., plurality of image capturing regions) of an object (see column 5, lines 14-55) to image capturing means 40, Miyakawa et al therefore provides substantially the same if not the same single solid state image sensing device that has a plurality of image capturing regions as claimed. And contrary to the applicant's statements, it is submitted that the particular optical paths 1 and 2 of Miyakawa et al provides substantially the same if not the same separate images

Art Unit: 2613

forming different image capturing regions and a different optical system that is associated with each image capturing region. And, it is considered obvious again that such single image capturing device of Miyakawa et al may certainly be provided for the three dimensional capturing and display system of Sekine et al whereby each set of lenses and reflections means corresponds to a different one of the image capturing regions.

Regarding the applicant's arguments at page 6 of the amendment filed April 22, 2003 concerning in general that "... Sekine et al's system discloses two light beams that are orthogonal to each other in the optical unit 120. Using Sekine et al's optical system, it would not be possible to transmit Sekine et al's two orthogonal light beams onto Miyakawa's single camera 40. In fact, Miyakawa purposefully alternates its two optical paths through its mirror 25 so that its optical paths are not orthogonal. Thus, it would not be possible to use Sekine et al's system with Miyakawa's camera to provide three-dimensional image ...", the Examiner wants to point out that Miyakawa et al teaches the desire to reduce the number of cameras from two to one for producing three dimensional images for viewing (see column 3, lines 58-68, column 9, lines 27-35), and in the preferred embodiment Figure 1 of Miyakawa, two optical paths are alternately being outputted for such three dimensional viewings. As such, it is considered obvious to provide the associated mirrors and shutters as shown in Figure 1 of Sekine to merge the orthogonal images within optical unit 120 of Sekine into a single camera 40 of Miyakawa et al, thereby providing substantially the same if not the same three dimensional capturing apparatus as claimed. Sekine et al and Miyakawa et al both deal with three dimensional capturing and imaging, and it is

Art Unit: 2613

further submitted that the combination of Sekine et al and Miyakawa et al renders obvious the claimed invention for the above reasons.

Regarding the applicant's arguments at pages 7-8 of the amendment filed April 22, 2003 concerning the rejection of claims 2-4, 6, and 7, the Examiner wants to point out that such arguments have been addressed in the above.

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Art Unit: 2613

8. Any response to this final action should be mailed to:

Box AF

Commissioner of Patents and Trademarks

Washington, D.C. 20231

or faxed to:

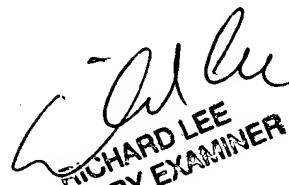

(703) 872-9314, (for formal communications; please mark "EXPEDITED
PROCEDURE") (for informal or draft communications, please label
"PROPOSED" or "DRAFT")

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive,
Arlington, VA., Sixth Floor (Receptionist).

Art Unit: 2613

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Richard Lee whose telephone number is (703) 308-6612. The Examiner can normally be reached on Monday to Friday from 8:00 a.m. to 5:30 p.m, with alternate Fridays off.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group customer service whose telephone number is (703) 306-0377.
